Set breakpoint in line and paused code in line:

I made an age calculator to say in "input years" your pet will be x years old, and made the error

of adding a string to an integer

The screenshot shows the Chrome DevTools interface with a breakpoint set at line 126 of `script.js`. The code at this line is `var inputValue = $('#futureAge').val();`. The right-hand pane indicates the breakpoint is paused. The 'Scope' section shows the current context, where `inputValue` is undefined. The 'Call Stack' shows the function `calculateFutureAge` at line 126.

We can see that the input value is a string

```
return;
}
*/
var futureAge = inputValue + pet_info.age; futureAge
var message = 'In ' + inputValue + ' years ' + pet_inf
$('#notification').text(message).fadeTo(0, 1).delay(2000).fadeOut(1000);
```

And that the age is not a string

```
4
+ pet_info.age; fu
tValue + ' years ' +
ssage).fadeTo(0, 1).
```

This is caused by this line:

```
var inputValue = ($('#futureAgeInput').val());
```

And can be fixed by ensuring that we parse the input as an int:

```
var inputValue = parseInt($('#futureAgeInput').val());
```
